

Theory

Introduction to HTTP Protocol:

HTTP (HyperText Transfer Protocol) is a communication protocol used between a client (browser) and a server. It defines how requests are sent and responses are received on the web.

Role of HTTP in Web Communication:

- It allows clients to request web pages from servers.
- It transfers data such as HTML, images, and JSON.
- It follows a request-response model.

HTTP Request Headers:

- Sent by the client to the server.
- Contain information about the request.
- Examples:
 - Host → Server name
 - User-Agent → Browser details
 - Accept → Type of data client can handle

HTTP Response Headers:

- Sent by the server to the client.
- Provide information about the response.
- Examples:
 - Content-Type → Type of content (HTML, JSON)
 - Content-Length → Size of response
 - Server → Server details
