

2. Advantages of Servlets over CGI

Servlets are much more efficient and powerful than CGI (Common Gateway Interface). Here are the main advantages:

1. Better Performance

- CGI creates a **new process for each request** → slow and resource-heavy.
- Servlets use **threads within a single process** → faster and scalable.

2. Platform Independence

- Servlets are written in Java → run on any system with JVM.
- CGI programs depend on the language used (C, Perl, etc.).

3. Efficient Resource Usage

- Servlets stay loaded in memory after first request.
- CGI loads and unloads program every time.

4. Built-in API Support

- Servlets provide powerful APIs for:
 - Session management
 - Cookies
 - Database connectivity (JDBC)
- CGI lacks built-in structured APIs.

5. Security

- Servlets run inside a **controlled server environment** (like a servlet container).
- CGI programs can be more vulnerable if not carefully written.

6. Maintainability

- Servlets follow object-oriented programming → easier to manage and extend.
- CGI scripts are often harder to maintain.
